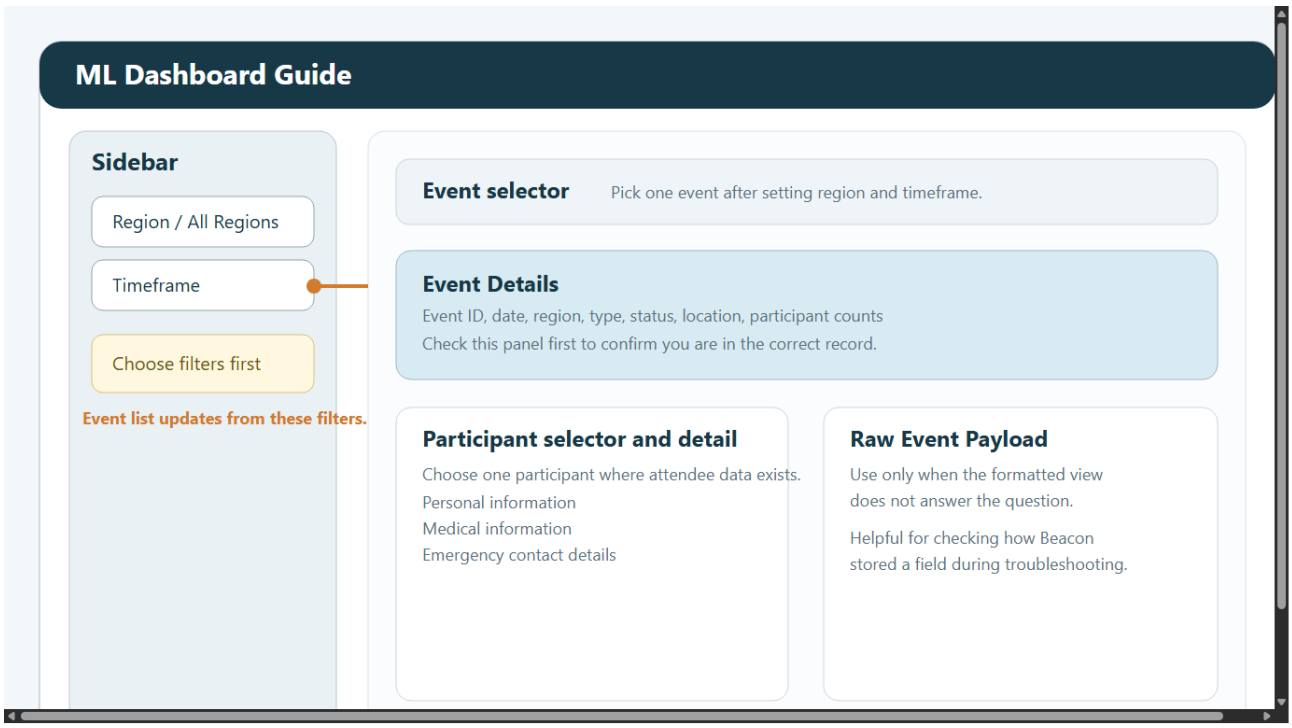
Mountain Leader Dashboard Manual

Audience: ML users

Scope: event review, participant checks, and case study capture



1. Introduction

This manual explains how Mountain Leaders use the dashboard for event-by-event operational work.

The ML role is designed for people who need to:

- review one event at a time
- check event details before delivery
- review participant information where it is available
- review medical and emergency information where it is operationally necessary
- record or review case studies after delivery

ML users can open:

- `ML Dashboard`
- `Case Studies`
- `Data Request Form`

ML users cannot open:

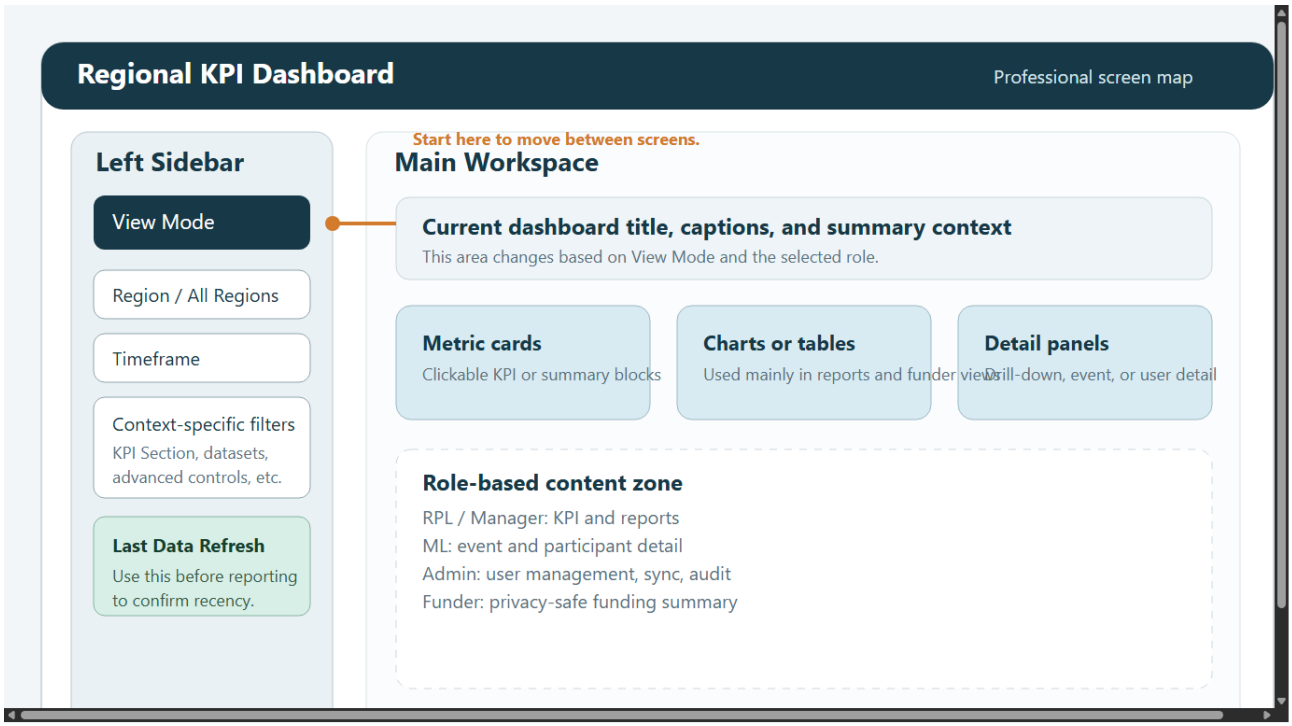
- `Admin Dashboard`
- `KPI Dashboard`
- `Custom Reports Dashboard`
- `Funder Dashboard`

This role is intentionally focused. It is not for broad reporting or system administration. It is for safe, event-level operational checking.

2. Before you begin

When you sign in:

1. Enter your email address and password.
2. Change your password if prompted.
3. Use `View Mode` to confirm whether you need `ML Dashboard` or `Case Studies`.
4. Check your region and timeframe before selecting an event.



The most common reason an event appears to be missing is not that the event is absent, but that the region or timeframe is too narrow.

3. What the ML role is for

Use this role when you need to:

- review the details of a single event
- confirm you are looking at the correct event before delivery
- check participant information where the source data contains it
- review medical or emergency notes where appropriate
- add a case study after the event

Do not use this role as if it were a reporting dashboard. If your question is about trends, totals, exports, or wider performance, that belongs with a `Manager`, `RPL`, or `Admin` user.

4. Finding the right event

The sidebar usually gives you:

- `All Regions` or a specific region
- timeframe controls

After setting those filters, use the `Event` selector on the page to choose the event.

4.1 Recommended workflow

1. Start with the broadest sensible timeframe.
2. Use `All Regions` if you are unsure which region the event appears under.
3. Open the event selector.
4. Choose the event by name and date.
5. Confirm the event details before reading participant information.

4.2 If the event is not visible

Check these in order:

1. Widen the timeframe.
2. Switch to `All Regions`.
3. Look again in the event selector.
4. If it still is not there, ask a `Manager` or `Admin` to confirm that the event exists in the synced source data.

5. Event Details

When you select an event, the dashboard shows an `Event Details` area.

Typical information may include:

- event ID
- event name
- date
- region
- event type
- participant count
- location

- status
- description

5.1 Why this section matters

Always review `Event Details` first. This confirms:

- you chose the correct event
- the date matches what you expect
- the region matches what you expect
- the event type and status make sense

5.2 Step-by-step review

1. Read the event name.
2. Read the event date.
3. Check the region.
4. Check the event type.
5. Check the participant count.
6. Check the location and status if shown.
7. Only then move on to participant information.

This order reduces the risk of reviewing the wrong record.

6. Participant information

If attendee data exists, the dashboard lets you review participants one at a time.

Possible information areas include:

- personal information
- participant record details
- medical information
- emergency contact details

Not every event contains every field. Some events contain only partial attendee information. Some may contain counts but not full person-level detail.

6.1 Step-by-step participant review

1. Choose the event.
2. Open the participant selector if it is shown.
3. Choose the participant you need.
4. Review the available information carefully.
5. Move to the next participant only if there is a legitimate operational need.

6.2 Good practice

- review only what you need
- avoid casual browsing of personal records
- treat all participant data as sensitive
- if something looks missing, remember the source data may not include it

7. Medical and emergency information

Some records include medical or emergency details.

These fields should be used carefully and only when there is a clear operational reason.

7.1 When it is appropriate to use this information

Use it for:

- safe event delivery
- checking essential support needs
- confirming important practical information before or during an event

7.2 When it is not appropriate

Do not use it:

- out of curiosity
- in casual discussion
- for wider sharing than is necessary

7.3 If the section is blank

If medical or emergency sections are blank, the usual explanation is that the source record simply does not contain those values. It does not always mean something is broken.

8. Additional event information

The page may include extra event information in a readable format beyond the main summary panel.

Use this area when:

- the main event summary does not show enough detail
- you need to check how the event was recorded
- support staff ask you to confirm a field from the event record

Always cross-check the extra detail against the main `Event Details` area so that you stay clear about which event you are reviewing.

9. Case Studies

ML users can also read and upload case studies.

This is useful for recording:

- participant feedback
- a short story of impact
- reflections after an event

9.1 Reading case studies

1. Open `Case Studies`.
2. Use region and date filters if needed.
3. Review the titles and dates.
4. Read the most relevant story.

9.2 Adding a case study

Use this process:

1. Open `Case Studies`.
2. Filter first to avoid creating a duplicate.
3. Add a clear title.
4. Add the story text.
5. Set the correct date.
6. Set the correct region.
7. Submit the form.
8. Review the saved result.

9.3 Good case study practice

- make the title specific
- keep the story factual and readable
- check the date carefully
- choose the right region
- avoid sharing unnecessary sensitive personal detail

10. Data Request Form

Use `Data Request Form` when you need to request data access or ask for a formal review of what information can be shared.

All fields are required:

- `Name`
- `Email`
- `Date`
- `Time`
- `Reason for data request`

Suggested workflow:

1. Open `Data Request Form`.
2. Choose your name.

3. Choose your email.
4. Set the relevant date and time.
5. Explain the request clearly.
6. Submit the form.

After submission, `Admin` and `Manager` users are notified in the dashboard.

11. Common tasks

10.1 Check an event before delivery

1. Open `ML Dashboard`.
2. Set region and timeframe.
3. Choose the event.
4. Review `Event Details`.
5. Review participant information where available.
6. Review medical and emergency detail where appropriate.

10.2 Confirm participant information after delivery

1. Open `ML Dashboard`.
2. Choose the event.
3. Open the participant selector.
4. Review the available participant detail carefully.
5. If key information appears to be missing, ask a `Manager` or `Admin` to confirm the source data.

10.3 Add a case study after an event

1. Open `Case Studies`.
2. Filter first to avoid duplicates.
3. Add the story with a clear title.
4. Set the correct date and region.
5. Submit and review the saved result.

10.4 Submit a data request

1. Open `Data Request Form`.
2. Complete all required fields.
3. Submit the request.
4. Wait for Manager or Admin follow-up.

12. Good working practice

- set the correct date range before choosing an event
- confirm the event details before reviewing participants
- review medical and emergency information only where needed
- report missing or surprising data if the event should contain it
- use the dashboard for operational need, not casual browsing
- use the Data Request Form for permission questions rather than informal messages

13. Troubleshooting

No events are showing

1. Widen the timeframe.
2. Switch to `All Regions`.
3. Check again in the event selector.
4. If still missing, ask a `Manager` or `Admin` to confirm the event has synced.

No participant names are shown

- some events include only counts or partial attendee data
- visibility depends on what exists in the source data

Medical or emergency sections are blank

- the source record may not contain those values
- not every event includes them

The wrong event appears selected

1. Check the date in the selector.
2. Adjust region and timeframe.
3. Choose the event again.
4. Confirm the event details before continuing.
