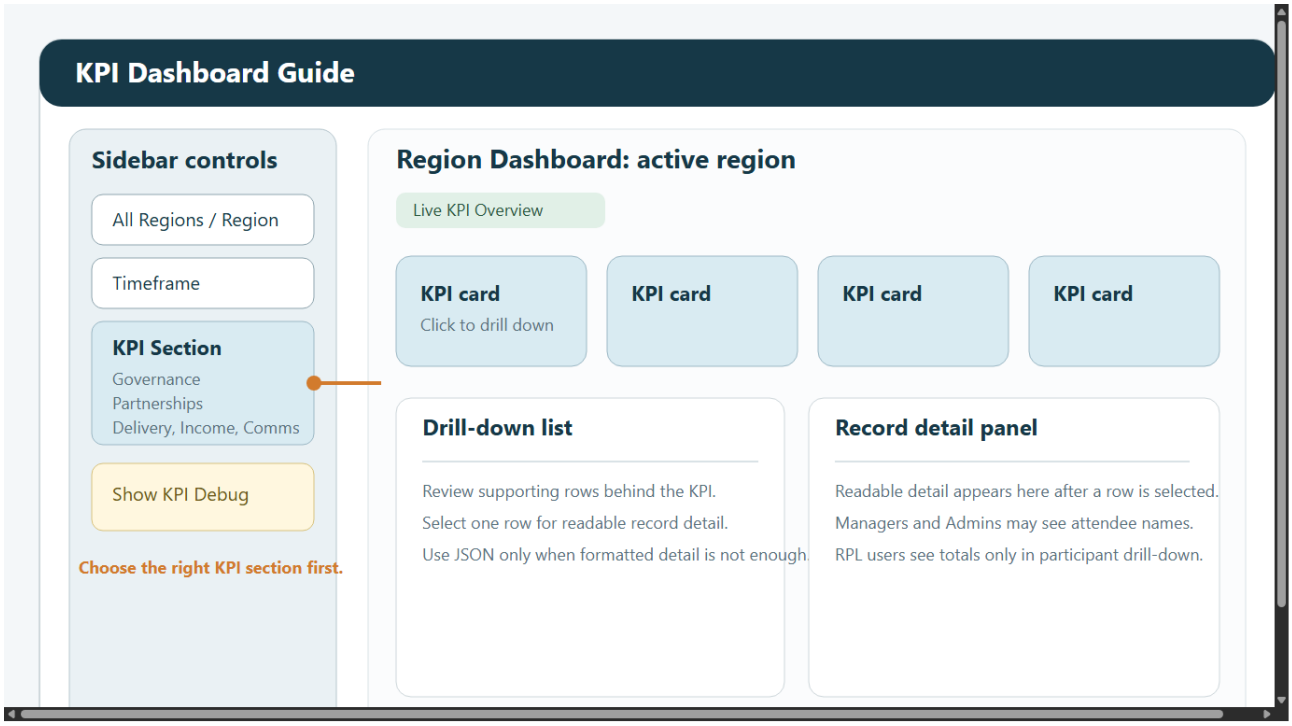
Manager Dashboard Manual

Audience: Manager users

Scope: operational reporting, KPI validation, event review, funder conversations, and case study evidence



1. Role overview

Managers have broad operational access across the reporting and delivery views.

Available views:

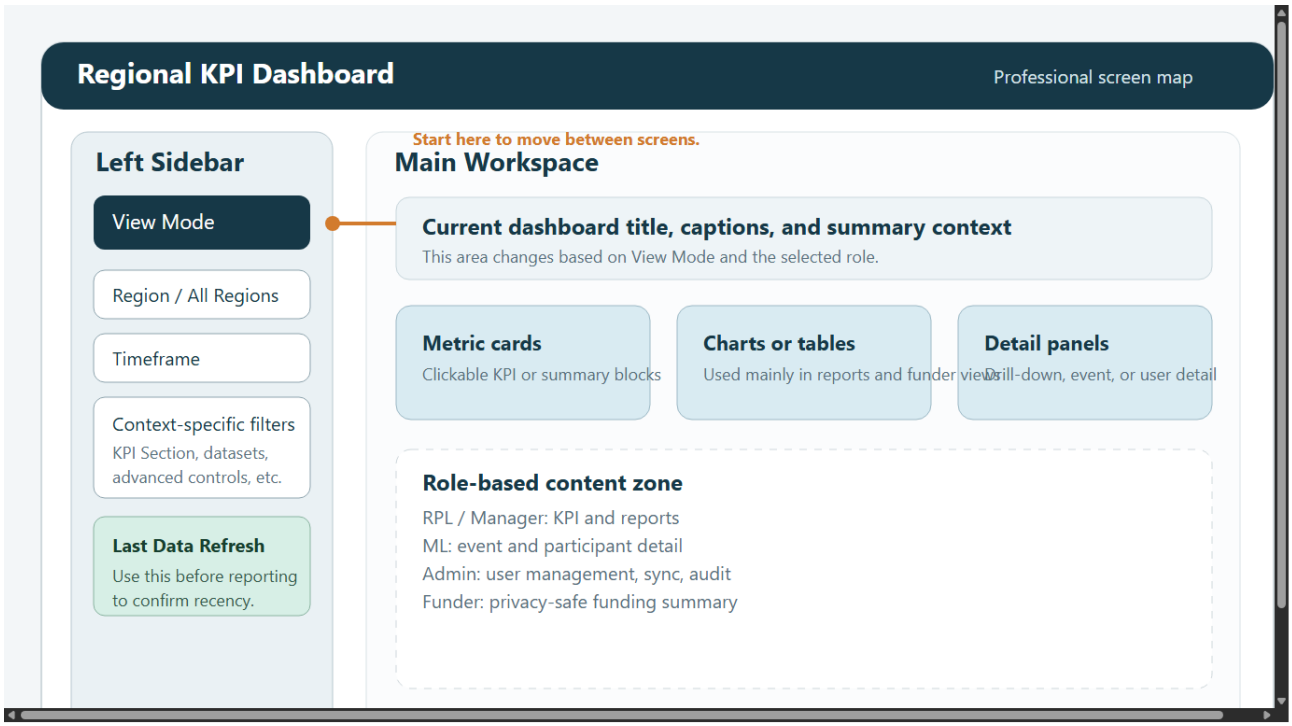
- KPI Dashboard
- Custom Reports Dashboard
- Case Studies
- Funder Dashboard
- ML Dashboard

Managers cannot access:

- `Admin Dashboard`

2. Quick start

1. Sign in and change your password if prompted.
2. Use `View Mode` in the sidebar to switch between screens.
3. Check `Last Data Refresh` before relying on figures for external reporting.
4. Start with KPI for summary, then move to reports or ML view when you need detail.



3. Shared filters and navigation

Across most manager workflows you will use:

- `View Mode`
- region filters
- timeframe filters

Typical timeframes:

- `All Time`
- `Year`
- `Quarter`
- `Month`
- `Week`
- `Custom Range`

Use a wide range first when investigating missing data, then narrow once you know the records are present.

4. KPI Dashboard

The KPI screen is the main operational summary view for managers.

4.1 KPI sections

Use the section selector to move between:

- `Governance`
- `Partnerships`
- `Delivery`
- `Income` when region is `Global`
- `Comms` when region is `Global`
- `Case Studies`

4.2 Drill-down behaviour

Managers can click KPI cards and inspect supporting rows in detail.

In `Delivery > Total Participants`, managers can see:

- attendee names where available
- attendee IDs where available
- placeholder entries when only participant counts exist

This makes the manager role suitable for reconciling participant totals or validating delivery evidence.

4.3 KPI Debug

Managers can turn on `Show KPI Debug` from the sidebar.

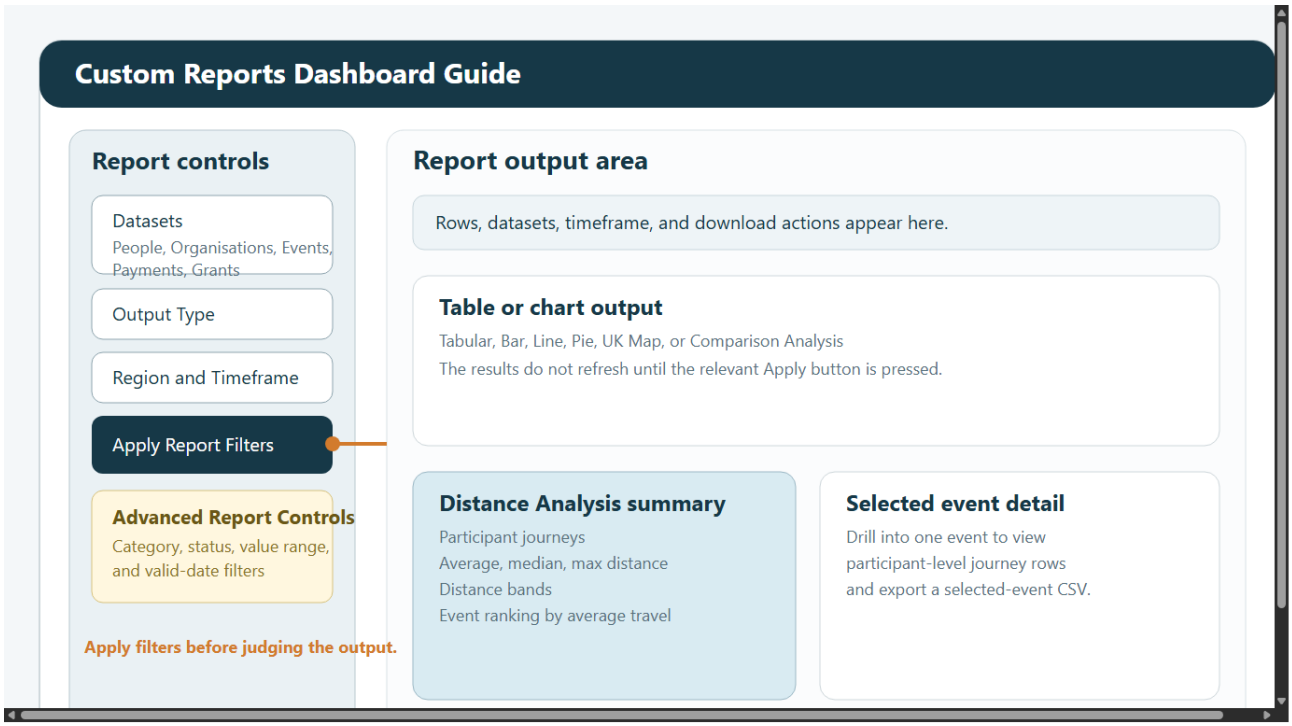
Debug mode exposes validation counters such as:

- people in region
- volunteers
- steering volunteers
- events in region
- walk events
- participants
- grants in region
- bids submitted

Use it when a headline figure looks wrong and you want to confirm whether the underlying dataset is the issue or the KPI logic is the issue.

5. Custom Reports Dashboard

The report builder is the best place for structured analysis and export.



5.1 Standard workflow

5. Choose the relevant datasets.
6. Select the output type.
7. Set region and timeframe.
8. Click `Apply Report Filters`.
9. Refine with `Advanced Report Controls` if needed.
10. Click `Apply Advanced Filters`.
11. Export the resulting CSV if required.

5.2 Strong use cases for managers

- monthly and quarterly reporting packs
- regional comparisons
- grant and payment reviews
- delivery trend reviews
- evidence packs for leadership or trustees

5.3 Distance Analysis

Distance Analysis is especially useful for managers because it reveals reach and travel burden across delivery.

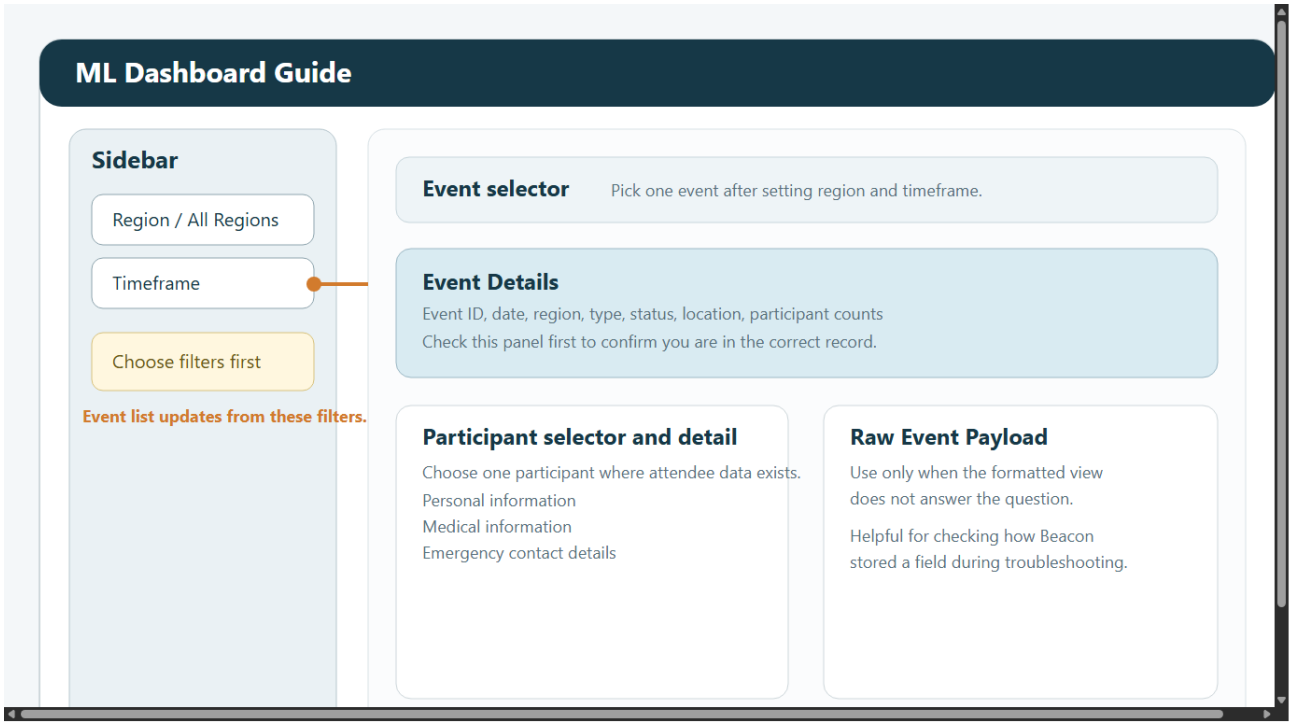
Use it to:

- rank events by average participant travel
- inspect the participant-level journey rows for one event
- export a selected event or the full dataset

If the output is empty, review postcode quality and whether resolved distance filtering is excluding rows.

6. ML Dashboard

Managers can use the ML screen for event-level operational detail without needing Admin permissions.



Recommended workflow:

12. Set the region and timeframe.
13. Choose the relevant event.
14. Review the event details panel.
15. Select a participant if attendee data exists.

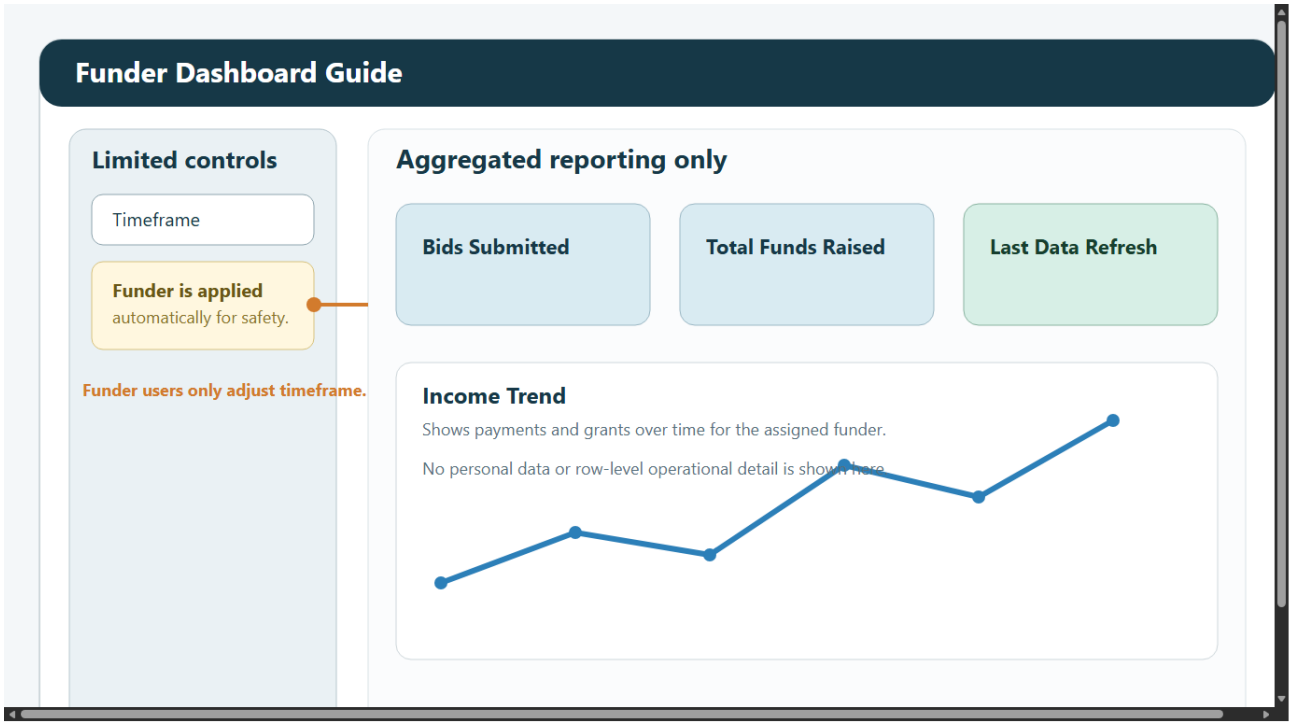
16. Review personal, medical, and emergency fields carefully.
17. Use the raw event payload only when deeper investigation is needed.

Use this screen when:

- an event record needs checking
- attendee detail needs validating
- support staff ask for confirmation of what Beacon supplied

7. Funder Dashboard

Managers can open the Funder Dashboard and choose a funder from the selector.



Use it for:

- sponsor update meetings
- checking funding trends
- reviewing bid totals and funds raised

- quality-assuring what a funder-facing user will see

Important interpretation note:

- funder-related financial measures follow the selected funder
- wider operational figures remain region and timeframe based

8. Case Studies

Managers can read, filter, and upload case studies.

This is useful when you need a narrative example to sit alongside KPI or report data.

Suggested use:

- add case studies after notable delivery
- tag the right region and date
- keep titles descriptive so other staff can find them later

9. Recommended operating pattern

18. Start in KPI for the headline view.
19. Use `Show KPI Debug` if a number needs validating.
20. Move to Custom Reports for structured analysis or export.
21. Move to ML Dashboard when the question is event-specific.
22. Use Funder Dashboard for sponsor-facing summaries.

10. Troubleshooting

A KPI number looks wrong

- switch on `Show KPI Debug`
- narrow the timeframe
- drill into the KPI card to inspect the source rows

The report did not refresh

- click `Apply Report Filters`
- click `Apply Advanced Filters` if advanced controls changed

No attendee detail is visible

- some events only contain counts or partial attendee detail
- names and IDs depend on the source Beacon payload

The Funder Dashboard looks empty

- try `All Time`
- change the selected funder
- confirm the selected funder appears in grants or payments
